

Structural Surveys

We offer assessment services to the built environment to assist structural engineers, project managers and architects. This is often carried out in conjunction with our [Condition Survey Work](#).

The structural survey work that we undertake is predominantly to provide our clients with structural as-built drawings for existing structures to enable the accurate design/costing of any redevelopment and refurbishment works.

The information that we can provide includes foundation details, with information on the bearing strata; structural form, including load path information; structural detailing including reinforcement layout in reinforced concrete structures and connection details in all building materials.

Our dedicated team, including Chartered Engineers, can provide accurate and concise information in the form of AutoCAD drawings to enable the design process to continue with a comprehensive knowledge of the structure.
